

Addendum: Measurement Clarification for 'Are morphological characteristics of *Parrotia* (Hamamelidaceae) pollen diagnostic for species differentiation?

Dear Colleagues and Readers,

On behalf of all co-authors,

I wish to inform you of a minor correction in our recently published article titled "Are morphological characteristics of *Parrotia* (Hamamelidaceae) pollen diagnostic for species differentiation?" published in the journal *Review of Palaeobotany and Palynology* by Adroit et al., 2022 (<https://doi.org/10.1016/j.revpalbo.2022.104776>).

In Table 1 and 3, where it is mentioned 'Nlumen = number of lumina per 10 μm^2 ', the accurate measurement should read '**number of lumina per 100 μm^2** '. This typographical oversight does not influence any calculations or conclusions of the study, as the figure scales are correctly represented at 10 μm . This error is also present in the supplementary data.

We sincerely apologize for any confusion caused and appreciate your understanding and support of our research.

Dr. Benjamin Adroit
